

# Conceptual Spaces

A Bridge Between Neural and Symbolic  
Representations?

Lucas Bechberger

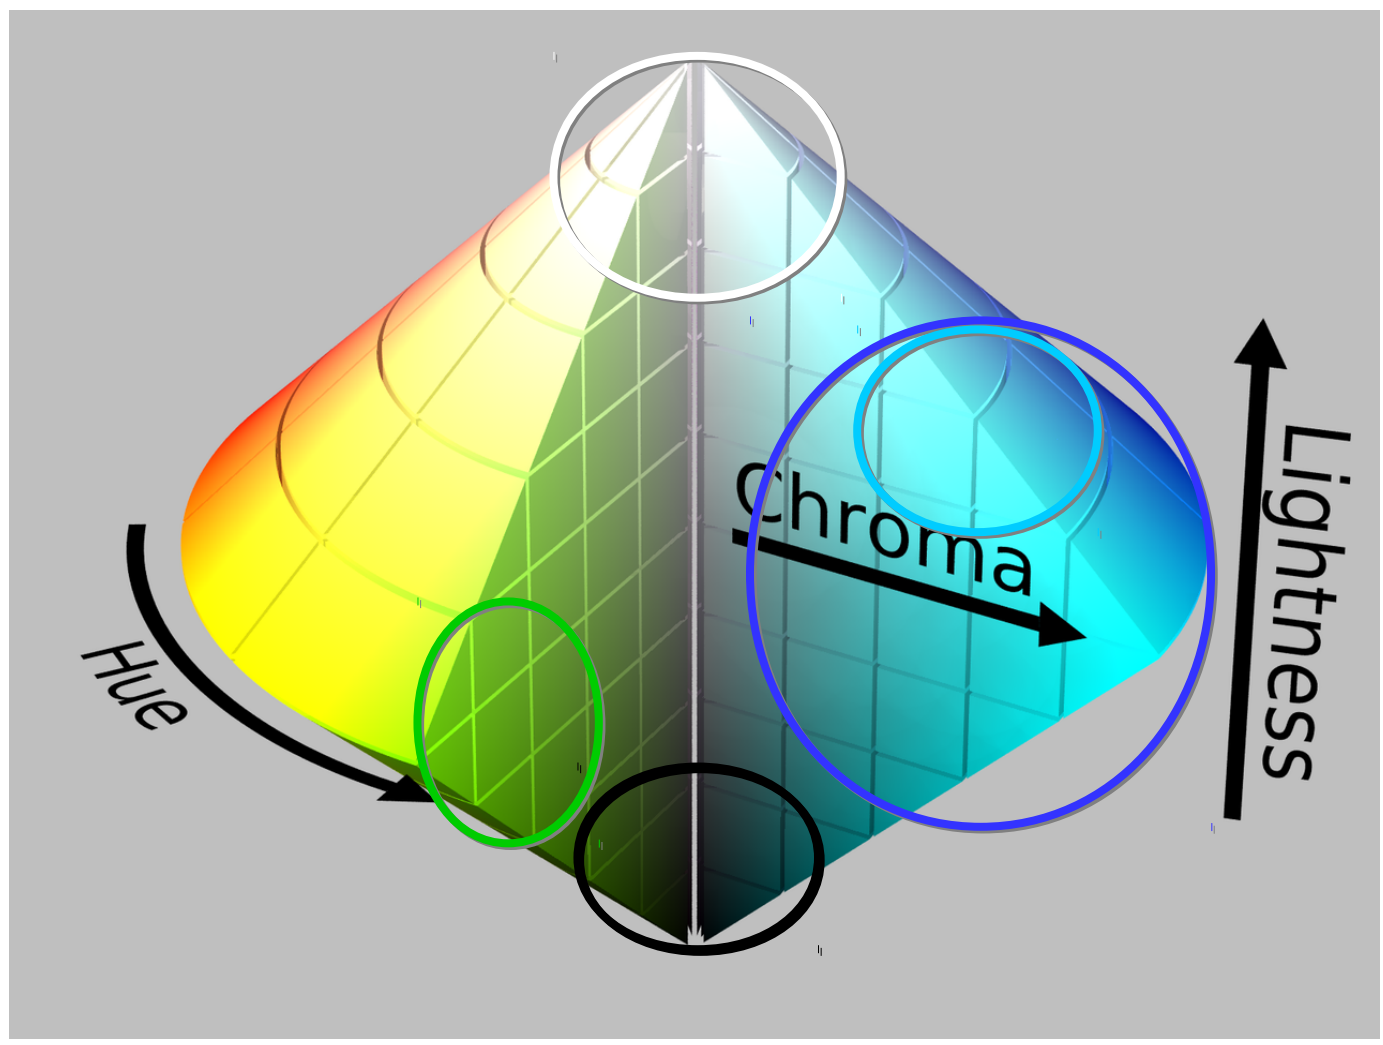

Peter Gärdenfors, “Conceptual Spaces: The Geometry of Thought”, MIT press, 2000

- Quality dimensions
  - Different ways stimuli are judged to be similar or different
  - Interpretable by a human
  - E.g., temperature, weight, brightness, pitch
- Domain
  - Set of dimensions that inherently belong together
  - Color: hue, saturation, and brightness
- Distance in this space is inversely related to similarity
  - Within a domain: Euclidean distance
  - Between domains: Manhattan distance

- A natural property is a convex region within a domain.

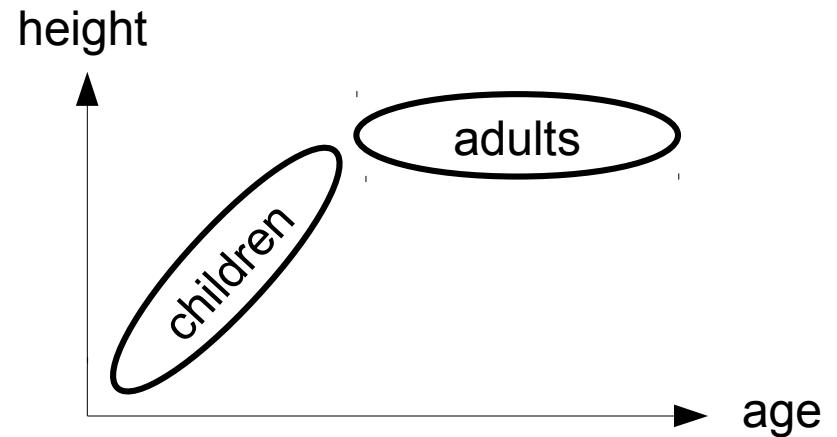

# Example: The Color Domain

[https://en.wikipedia.org/wiki/HSL\\_and\\_HSV#/media/File:HSL\\_color\\_solid\\_dblcone\\_chroma\\_gray.png](https://en.wikipedia.org/wiki/HSL_and_HSV#/media/File:HSL_color_solid_dblcone_chroma_gray.png)

- Example: „apple“

- Color: red
- Shape: spherical
- Texture: smooth
- Taste: sweet

- Defined across multiple domains: combination of properties

- Different „importance“ to the concept (influenced by context)
- Potentially correlated

- Prototype theory of concepts
  - Each concept is mentally represented by a prototype
  - e.g., the most typical instance
  
- Conceptual spaces
  - Central point of convex region can be interpreted as prototype
  - Voronoi-tesselation based on prototypes results in convex sets

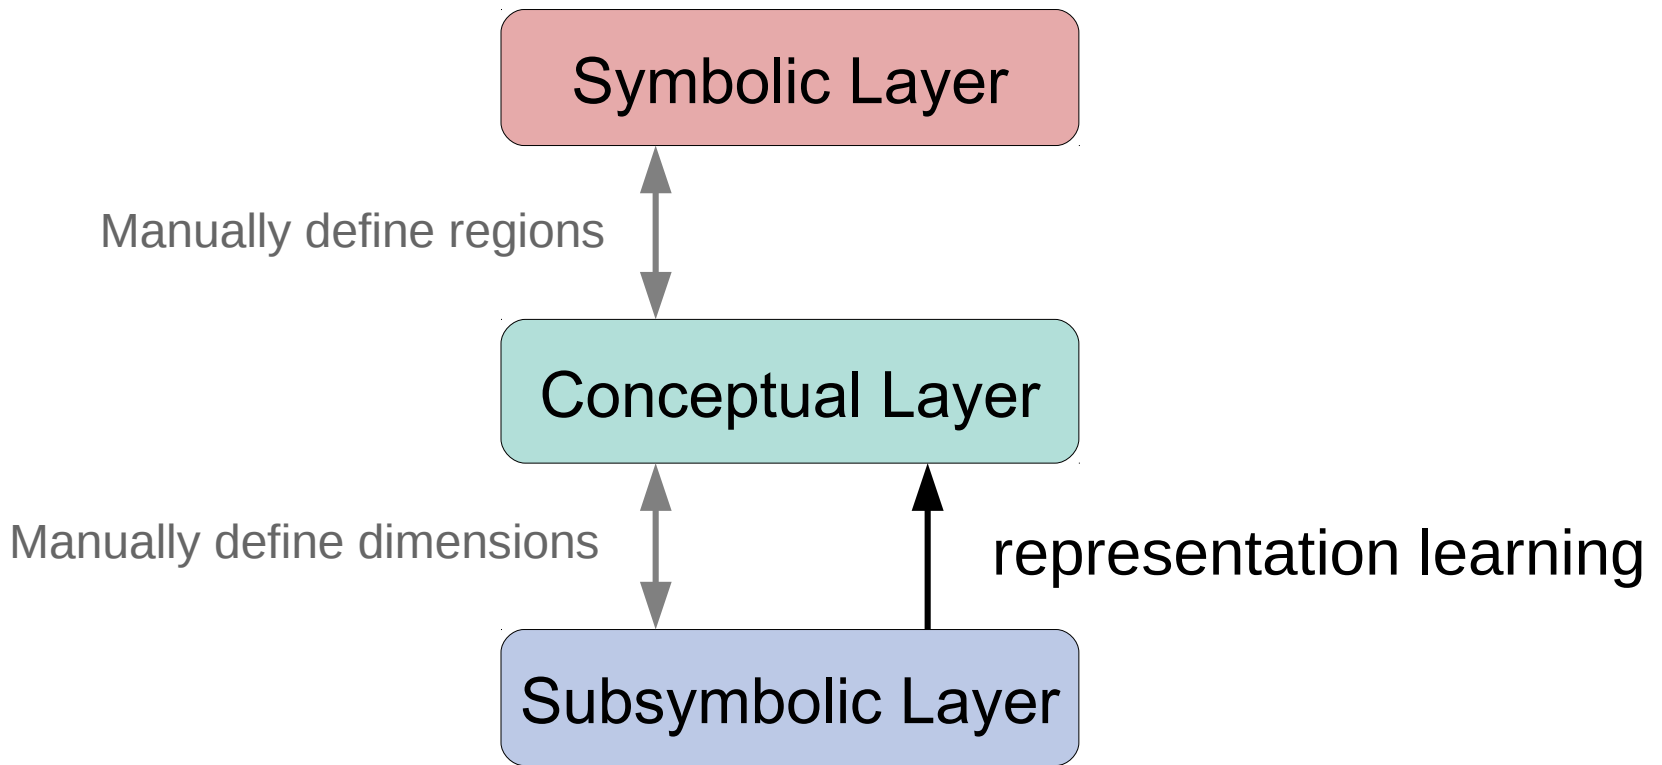

<https://commons.wikimedia.org/wiki/File:CentroidalVoronoiTessellation2.png>

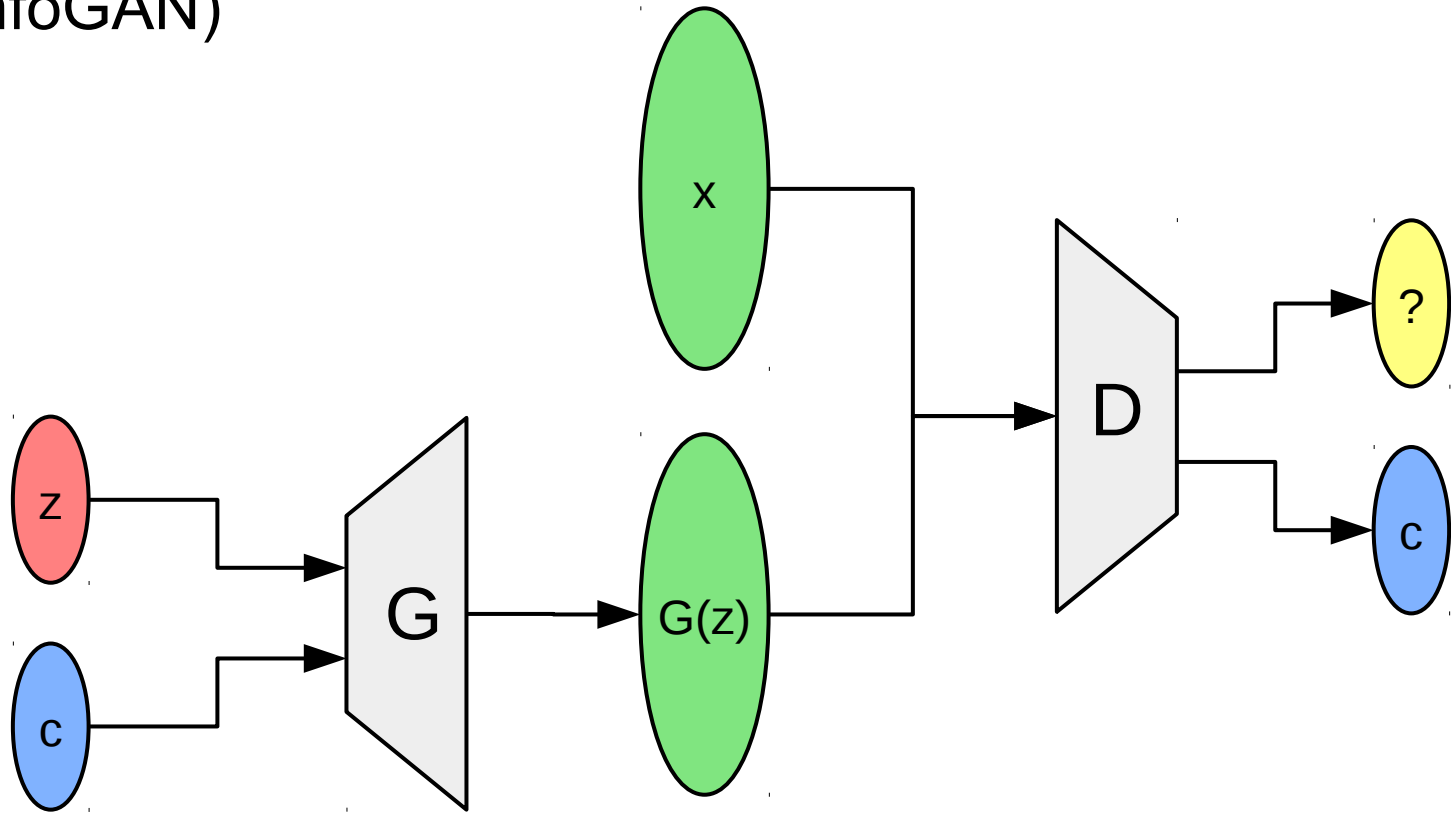

- Geometric relationships between regions
  - ***Sky blue*** is a subset of ***blue***
  - Projecting ***apple*** onto the color domain results in ***red*** region
- Concept combination: “green banana”
  - Narrow down the color region of ***banana*** to ***green*** region
  - Correlations between domains yield further updates:
    - Consistency is ***solid***, taste is ***bitter***
- Use betweenness and similarity for plausible reasoning
  - Both bachelor and PhD students have to pay a certain fee
  - What about Master students?

J. Derrac and S. Schockaert, “Inducing Semantic Relations from Conceptual Spaces: A Data-Driven Approach to Plausible Reasoning”, *Artificial Intelligence*, 2015

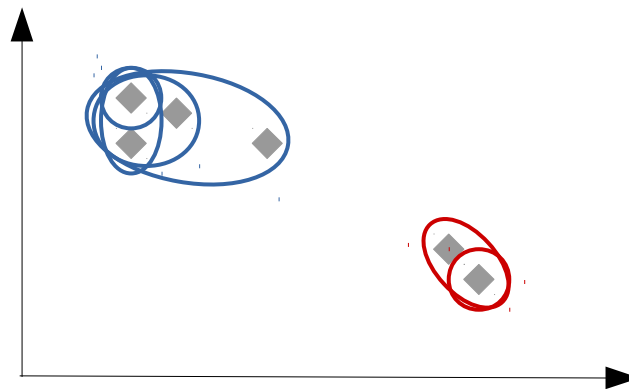

- Information Maximizing Generative Adversarial Networks (InfoGAN)

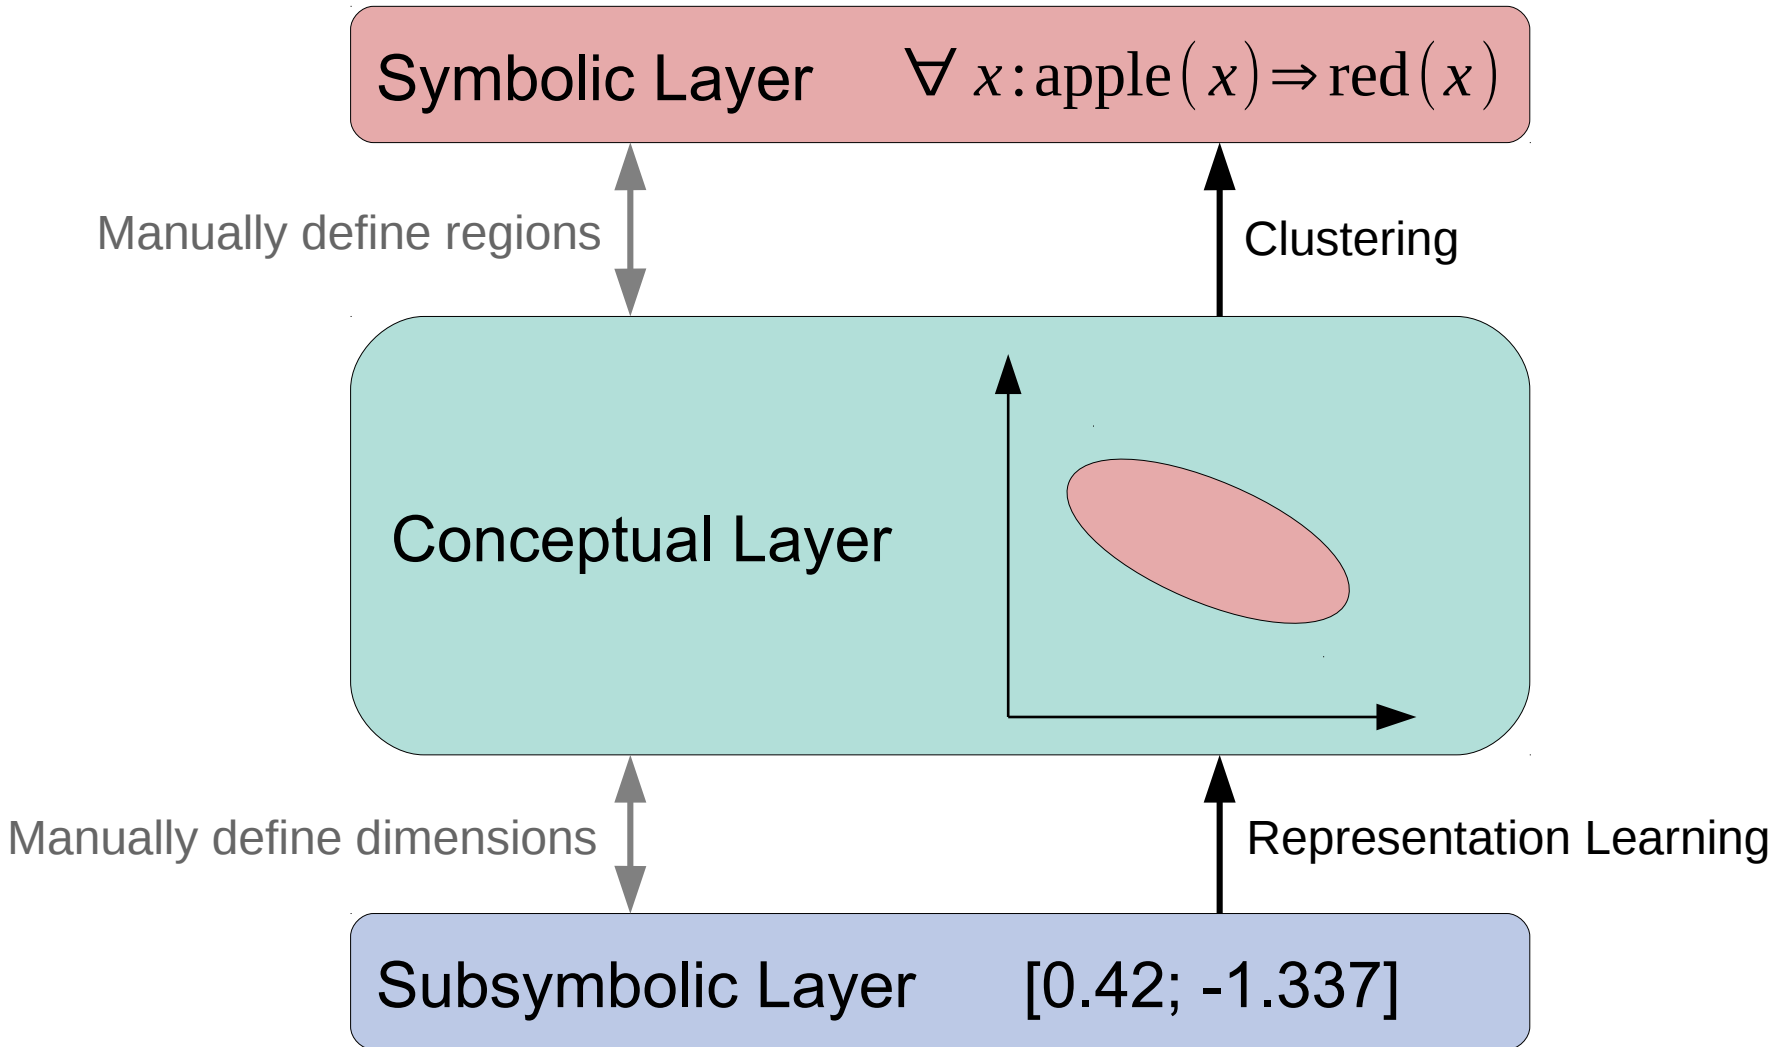

X. Chen et al., "InfoGAN: Interpretable Representation Learning by Information Maximizing Generative Adversarial Nets", Advances in Neural Information Processing Systems, 2016

- We look for meaningful regions in the conceptual space
  - Concepts = clusters of data points
- Observed objects usually come without class information
  - unsupervised
- Observing one object at a time, limited memory
  - Stream of data points, incremental processing
